Chapter 11 Inflation and Its Impact on Project Cash Flows

Measure of Inflation

11.1

$$1.1(1+f)^9 = 2.62$$

 $f = 10.123\%$
 $100(1+0.10123)^9 = 238.18$

11.2

(a) Average price index:

$$150.6(1+f)^4 = 165.8$$
$$f = 2.433\%$$

(b)
$$165.8(1+0.02433)^5 = 186.98$$

11.3

$$100(1+0.05)(1+0.08) = 113.40$$

$$100(F/P, f, 2) = 113.40$$

$$f = 6.4894\%$$

11.4 Given:
$$f = 7\%$$

$$1(1+0.07)^{-n} = 0.5$$

$$1.07^{-n} = 0.5$$

$$(-n) \log 1.07 = \log 0.5$$

$$n = -\log 0.5 / \log 1.07$$

$$= 10.24 \text{ years}$$

Comments: If you use the Rule of 72, you may find $\frac{72}{7} = 10.29$ years which is very close to the actual value.

Actual versus Constant Dollars

11.5 Given: i = 12%, $\overline{f} = 5\%$, 10 annuity payments in actual dollars

$$P = \$4,500(P/A,12\%,10)$$

= \\$25,426

Comments: Since the annuity payments are made in actual dollars, we use the market interest rate to find its equivalent lump sum amount in today's dollars.

11.6 Given: i = 15%, $\overline{f} = 8\%$, maintenance costs are given in constant dollars, i' = 6.48%

$$P = \$25,000(P/F,6.48\%,1) + \$30,000(P/F,6.28\%,2)$$

$$+\$32,000(P/F,6.48\%,3) + \$35,000(P/F,6.48\%,4)$$

$$+\$40,000(P/F,6.48\%,5)$$

$$=\$132,894$$

$$A = \$132,894(A/P,15\%,5)$$

$$=\$39,644$$

11.7 Given: $i = 16\%, \overline{f} = 4\%$

n	Actual dollars	Constant Dollars
0	\$1,500	1,500(P/F,4%,0) = 1,500
4	2,500	2,500(P/F,4%,4) = 2,137
5	3,500	3,500(P/F,4%,5) = 2,877
7	4,500	4,500(P/F,4%,7) = 3,420

- 11.8 Given: P = \$25,000, i = 1% per month, $\overline{f} = 0.5\%$ per month
 - The 20th payment in actual dollars:

$$A_{20} = \$25,000(A/P,1\%,48) = \$658.35$$

• The 20th payment in constant dollars:

$$A'_{20} = $658.35(P/F, 0.5\%, 20) = $595.85$$

11.9

(a) Constant-dollar analysis: we need to find the inflation-free interest rate.

$$i' = \frac{i - f}{1 + f} = 5.607\%$$

Then, find the equivalent present worth of this geometric series at i'.

$$P = \$7,000(P/A_1, 8\%, 5.607\%, 4)$$
$$= \$27,428$$

(a) Actual-dollar analysis

Period	Net Cash Flow in Constant \$	Conversion factor	Net Cash Flow in Actual \$
1	\$7,000	$(1+0.07)^1$	\$7,490
2	7,560	$(1+0.07)^2$	8,655
3	8,165	$(1+0.07)^3$	10,002
4	8,818	$(1+0.07)^4$	11,559

$$P = \$7,490(P/F,13\%,1) + \$8,655(P/F,13\%,2) + \$10,002(P/F,13\%,3) + \$11,559(P/F,13\%,4) = \$27,428$$

Comments: As an alternative way of finding the equivalent cash flows in actual dollars, we may use the compound growth rate (geometric growth and inflation):

$$g = (1+0.08)(1+0.07)-1$$
= 15.56%
$$P = \$7,000(1.07)(P/A_1,15.56\%,13\%,4)$$
= \\$27,428

11.10 Given: i = 9%, $\overline{f} = 3.8\%$, we find the inflation-free interest rate as follows:

$$i' = (0.09 - 0.038)/(1 + 0.038) = 5.01\%$$

First compute the equivalent present worth of the constant dollar series at i':

$$P = \$1,000(P/A,5.01\%,4)$$
$$= \$3,545.13$$

Then, we compute the equivalent annual payment in actual dollars using i:

$$A = \$3,545.13(A/P,9\%,4)$$
$$= \$1,094.27$$

- 11.11 Given: i = 12%, $\overline{f} = 6\%$, bond interest rate = 9% compounded semiannually, face value = \$1.000
 - The 16th interest payment in actual dollars:

$$I_{16} = \$1,000(0.045) = \$45$$

• The 16th interest payment (8th year) in constant dollars:

$$I'_{16} = $45(P/F, 6\%, 8) = $28.23$$

Equivalence Calculation under Inflation

11.12 Given: i = 1% per month, $\overline{f} = 0.5\%$ per month, P = \$20,000, N = 60 months

$$i' = \frac{0.01 - 0.005}{1 + 0.005}$$

$$= 0.4975\%$$

$$A' = $20,000(A/P, 0.4975\%, 60)$$

$$= $386.38$$

- 11.13 Given: i' = 6%, $\overline{f} = 5\%$, N = 5 years, A = \$1.5 million in constant dollars
 - Market interest rate:

$$i = 0.06 + 0.05 + (0.06)(0.05) = 11.3\%$$

• Actual dollar analysis:

Period	Net Cash	Net Cash Flow	Equivalent
	Flow	in Actual \$	Present Worth
	in Constant \$		
1	\$1,500,000	\$1,575,000	\$1,415,094
2	1,500,000	1,653,750	1,334,995

3	1,500,000	1,736,438	1,259,429
4	1,500,000	1,823,259	1,188,140
5	1,500,000	1,914,422	1,120,887

$$P = \$1,575,000(P/F,11.3\%,1)$$

+\dots+\psi,914,422(P/F,11.3\psi,5)
=\\$6,318,545

- 11.14 Given: i = 0.75% per month, $\overline{f} = 0.5\%$ per month, P = \$5,000, N = 24 months, down payment = \$1,000
 - (a) Inflation-free interest rate:

$$i' = \frac{0.0075 - 0.005}{1 + 0.005} = 0.2488\%$$
 per month

(b) Equal monthly payment in constant dollars:

$$A' = $5,000(A/P, 0.2488\%, 24)$$

= \$214.87

- 11.15 Given: i = 6% compounded monthly, $\overline{f} = 5\%$ compounded annually, number of months to deposit = 240 months, number of annual withdrawals = 10, first withdrawal = 6 months after retirement
 - Effective inflation rate per semiannual: Since the first withdrawal is made after 6 months from retirement, it is necessary to calculate the effective inflation rate per semiannual.

$$\overline{f} = (\frac{1.05}{1})^{1/2} - 1 = 2.4695\%$$
 per semiannual

 Annual withdrawals in actual dollars: On semiannual basis, the first withdrawal will be made after 41 semiannual periods. Then, we can calculate the equivalent amount of this first withdrawal in actual dollars as follows:

$$A_{41} = $40,000(F/P, 2.4695\%, 41) = $108,753$$

The second withdrawal will be made after 43 semiannual periods. The equivalent amount of this second withdrawal in actual dollars is

$$A_{43} = $40,000(F/P, 2.4695\%, 43) = $114,190$$

The remaining withdrawals in actual dollars are

$$A_{45} = \$40,000(F/P,2.4695\%,45) = \$119,990$$

$$A_{47} = \$40,000(F/P,2.4695\%,47) = \$125,895$$

$$A_{49} = \$40,000(F/P,2.4695\%,49) = \$132,189$$

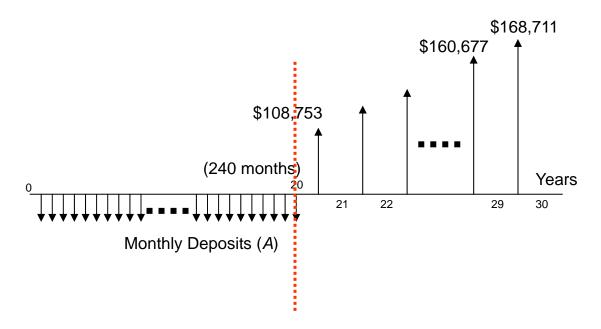

$$A_{51} = \$40,000(F/P,2.4695\%,51) = \$138,799$$

$$A_{53} = \$40,000(F/P,2.4695\%,53) = \$145,739$$

$$A_{55} = \$40,000(F/P,2.4695\%,55) = \$153,026$$

$$A_{57} = \$40,000(F/P,2.4695\%,57) = \$160,677$$

$$A_{59} = \$40,000(F/P,2.4695\%,59) = \$168,711$$

• Equivalence calculation: To find the required equal monthly deposit amount (*A*), we establish the following equivalence relationship:

$$A(F/A,0.5\%,240)(F/P,0.5\%,6) = \$180,753$$

$$+\$114,190(P/F,6.168\%,1)$$

$$+\$119,900(P/F,6.168\%,2)$$

$$\vdots$$

$$+\$168,711(P/F,6.168\%,9)$$

$$=\$1,035,236$$

$$A = \$1,035,236/476.08$$

$$= \$2,174.52 \text{ per month}$$

11.16 Given : i = 2% per quarter, $\overline{f} = 6\%$ per year

(a)

• Actual dollar analysis:

$$A(F/A, 2\%, 160) = \$600,000(F/P, 6\%, 40)$$
$$= \$6,171,431$$
$$A = \$5,420.69$$

• Constant dollar analysis: Given: i = 2% per quarter and $\overline{f} = 6\%$ per year, we need to find the inflation free interest rate (i') per quarter. In doing so, we first compute the equivalent inflation rate per quarter.

$$(1+\overline{f})^4 - 1 = 6\%$$
 $\overline{f} = 1.4674\%$ per quarter
$$i' = \frac{i-\overline{f}}{1+\overline{f}} = \frac{0.02 - 0.014674}{1 + 0.014674} = 0.525\%$$

Now, we can establish the following equivalence relationship:

$$A'(F/A, 0.525\%, 160) = $600,000$$

 $A' = $2,402.41$

(b)

• Effective annual interest rate:

$$i_a = (1 + 0.08/4)^4 - 1 = 8.243\%$$

• Equivalent value of \$600,000 in actual dollars at the end of 63rd birthday:

$$$600,000(F/P,6\%,40) = $6,171,431$$

• Conversion of a gradient series to an equivalent uniform series:

$$A = G(A/G, 8.243\%, 40)$$
$$= \$1,000(10.3746)$$
$$= \$10,374$$

• Amount of the first deposit (A_1) :

$$(A_1 + \$10,374)(F/A,8.243\%,40) = \$6,171,431$$

 $276.21A_1 = 3,306,026$
 $A_1 = \$11,969$

- 11.17 Given: i = 8% per year, $\overline{f} = 6\%$ per year
 - (a) Freshman-year expense in actual dollars:

$$$40,000(F/P,6\%,10) = $71,634$$

(b) Equivalent single-sum amount at n = 0

$$i' = \frac{i - \overline{f}}{1 + \overline{f}} = \frac{0.08 - 0.06}{1 + .06}$$

$$= 0.01887$$

$$P = [\$40,000(P/A,1.887\%,3) + \$40,000](P/F,1.887\%,10)$$

$$= \$129,077$$

(c) Required annual deposit in actual dollars:

$$A = $129,077(A/P,8\%,10) = $19,236$$

Effects of Inflation on Project Cash Flows

11.18 Consider the following project's after-tax cash flow and the expected annual general inflation rate during the project period:

End of year	Cash flow in actual dollars	Expected general inflation rate
0	-\$45,000	
1	26,000	6.5%
2	26,000	7.7%
3	26,000	8.1%

(a) The average annual general inflation rate:

$$(1+0.065)(1+0.077)(1+0.081) = 1.2399$$

 $(1+\overline{f})^3 = 1.2399$
 $\overline{f} = 7.4312\%$

(b) Constant dollars:

10	Actual	Constant
n	dollars	dollars

0	-\$45,000	-\$45,000
1	26,000	26,000(0.9390) = 24,414
2	26,000	26,000(0.8718) = 22,667
3	26,000	26,000(0.8065) = 20,969

Conversion factors:

$$(P/F, 6.5\%, 1) = 0.9390$$

 $(P/F, 7.7\%, 1)(P/F, 6.5\%, 1) = 0.8718$
 $(P/F, 8.1\%, 1)(P/F, 7.7\%, 1)(P/F, 6.5\%, 1) = 0.8065$

(c) The project is still profitable under inflationary economy.

$$P = -\$45,000 + \$24,414(P/F,5\%,1)$$

+\\$22,667(P/F,5\%,2) + \\$20,969(P/F,5\%,3)
=\\$16,925 > 0

(c) Present value gain (or loss) due to inflation:

$$i' = \frac{0.18 - 0.05}{1 + 0.05} = 12.38\%$$

$$PW(12.38\%)_{\text{no inflation}} = \$87,429$$

$$PW(18\%)_{\text{with inflation}} = \$92,958$$

$$\text{present value gain} = \$92,958 - \$87,429$$

$$= \$5,529$$

(d) Present value gain due to borrowing:

Net Financing Cost Net
$$n$$
 Principal Interest (A/T) Loan Flow 0 +\$120,000 +\$120,000 1 -(1-0.4)(10,800) -\$6,480 2 -\$120,000 -(1-0.4)(10,800) -\$126,480 $PW(18\%)_{Loan} = +$120,000 - $6,480(P/F,18\%,1) -$126,480(P/F,18\%,2) = $23,673$

Comments: The present value gain is possible here due to the fact that the firm was able to finance the project at a lower interest rate than its MARR. In practice, the lenders would raise their lending rates under inflationary economy, so that it is not likely to realize a significant gain.

11.21: (a) and (b) Net gains due to financing - \$906

	PW (10%) =	15,573		IRR (%) :	11.74%		

11.25

- (a) Real after-tax yield on bond investment:
 - Nontaxable municipal bond:

$$i'_{municipal} = \frac{0.09 - 0.03}{1 + 0.03} = 5.825\%$$

• Taxable corporate bond:

$$i'_{municipal} = \frac{0.12(1 - 0.3) - 0.03}{1 + 0.03} = 5.245\%$$

The municipal bond provides a better return on investment.

(b) Given
$$i = 6\%$$
, and $\overline{f} = 3\%$

$$i'_{savings} = 2.91\%$$

Since $i'_{municipal} > 2.91\%$ and $i'_{corporate} > 2.91\%$, both bond investments are better than the savings account. Now to compare two mutually exclusive bond investment alternatives, we need to perform an incremental analysis.

We cannot find the rate of return on incremental investment, as returns from municipal bond dominate those from corporate bond in every year. Municipal bond is a clear choice for any value of MARR.

	After-	tax Cash F	low
